# Isaac Asimov's "Reason"

Benjamin Pang, Phillip Wang
RobotaPsyche Spring 2022

Is it a good idea for us (real-world) people to allow robots to disobey their handlers, even if such disobedience is **necessary** to complete a task?

Is it safe for us (real-world) humans to put our faith in the **certainty** that the robots we create will follow these Laws? What **loopholes** in the Laws might exist that would allow robots to perform **unintended** actions?

If robots in the real world were made to believe in a **higher being** - human or not - what kind of **unintended** consequences might this pose?

Why claim the **creatorship of a robot**?

- Proof of construction?

- Easter Egg in the code?

- A kill switch?

- ……

Robo religiosus;

The idea that robots are inherently religious, either to human or to certain abstracth ideas or physical beings.

If robots have the **ability to reason**
will they have a religion?

Should they?

Thanks!
